Hair, Nail, and Feather Evidence

As DNA and other forensic technologies evolve, the significance of a single hair found within a crime scene grows each year. Cold homicide cases are being routinely re-examined for the smallest hair which might lend itself to mitochondrial DNA analysis. The compiler can bear witness to investigators' excitement in finding three previously undiscovered hairs on evidence from a brutal home invasion and murder of a mother in front of her five year old son. Even though those hairs would eventually be excluded as a subject's it provided hope and a second wind to an other wise stagnant investigation.

Stable isotope analysis also makes use of trace evidence including hair to determine the provenance and history of remains. The researcher should consider this section of the bibliography as much as citations compiled on DNA topics. It is also not a stretch for citations in **General Crime Scene and Death Scene Investigation** or **Criminal and Cultural Behavior** to be an important cross-reference. The context of all trace evidence, including hair and feathers, is important in defining the scope of potential evidence to collect from crime scenes. Research into the appearance and condition of biological trace evidence should be found under those sections addressing **Taphonomy**. The Section on **Scavenging** also cross-relates to this category in that those animals which may have fed on a victim's remains will inevitably shed hairs or feathers at the scene which might be confused with secondary evidence transferred by a perpetrator.

Fiber and Textile Evidence

As technology evolves in the production of synthetic fabrics and the treatment of natural fibers, so does the forensic consideration of same. Different fabrics, beyond trace evidence they will comprise at a scene, lend themselves toward the collection and preservation of other evidence including fingerprints or blood and other body fluids. The rate of decomposition differs among fiber types in different environmental settings. The type of fabrics represented at a scene may also suggest the circumstances and context surrounding the victim's death and remains. The compiler recalls the recovery of human remains identified as those of an individual missing for approximately seven years. What remained of his clothing included polyester fabric sweat pants covered by the synthetic threads left from otherwise decomposed cotton jeans. This layering of clothing was consistent with the particular day this victim was last seen – an abnormally cold Spring evening. Likewise, the position of clothing or trace fabrics across a scene might support arguments for paradoxical undressing associated with the final moments of hypothermia. It could support evidence or testimony of sexual assault, or it could suggest the unidentified victim was a homeless soul who wore as much of his clothing on his body as he could carry. Like many types of trace and biological evidence, their survivability is often misinterpreted. Time and exposure do not necessarily destroy viability. This is reflected in the discovery and analysis of prehistoric textiles throughout the world.

Other Trace Evidence Topics

This category includes miscellaneous types of trace materials which might be left at, or transferred from crime scenes, but are not included in the previous categories which address more commonly encountered materials. Some references in the category have provided surprising help in this compiler's investigations. In particular, one investigation involved alleged civil rights violations in which the victim was repeatedly kicked after failing to respond to police commands. The officers were unaware that the individual was autistic and was unable to understand the situation in which he found himself. In that case, proof of the kicking action was considered with the thought that trace amounts of shoe polish might be on the victim's coat. While compiling references for this category, those involving the forensic analysis of shoe polishes were found (Cole, et al. 1992 and 1994; Bryne, et al. 1994). The possibility that such a study existed surprised this compiler; and demonstrates that the forensic consideration of all sorts of substances are available for application to crime scene investigators. Shoe, Foot, and Tire Impression Evidence

Latent and/or patent impressions of feet, shoes, or tires have to exist at every crime until perpetrators master levitation into and out of the scenes. This type of evidence, like most represented in this bibliography is affected by topics addressed in other sections. Probably most affected by good crime scene search planning is the preservation of shoe and tire impressions. One of the first protocols learned by crime scene technicians is the establishment of a single path of access/egress for the crime scene. The purpose of the path is to avoid destroying questioned impressions or adding to those in other parts of the scene. Impressions may be made of a variety of matrices addressed in sections on **Blood and Body Fluids** and **Geoarchaeology and Soil Science**. Assessment of the crime scene prior to the search for and discovery of impression evidence may benefit from research addressed in **Criminal and Cultural Behavior**. As with every evidence topic, the ultimate goal is to accurately and effectively present it in court, (**Expert Testimony and Ethical Conduct**). Related to the creation of shoe impressions is an emerging discipline or application of forensic podiatry. Krishan and DiMaggio (2015) offer an overview of this topic.

Hurricane Charlie Damage

Mass Fatality and Human Rights Investigations

Terrorist actions, mass suicides, and "ethnic cleansings" unfortunately continue to make headlines with their massive losses of life. In the United States, the attacks on September 11, 2001 placed terms associated with terrorism within our everyday lexicon. In countries like Israel, Ireland, Lebanon and others, such terms were already in daily use. Where such news was once limited to commercial aircraft disasters or natural disasters, it seems to increasingly include the results of criminal acts requiring the services of multi-disciplinary teams of forensic experts. This section of the bibliography includes references mostly developed from the work of experts at mass graves in places like Kosovo, Rwanda, or Guatemala, or air disasters and explosions around the globe. Included among these references are those about high speed aircraft crashes involving one or two victims. Even though one or two victims may have been lost, the nature of the scene, trauma and wreckage was similar to that encountered with larger numbers of victims in commercial aircraft crashes. Not included are references to forensic engineering or mechanical aspects of mass transportation disasters. Recoveries involving known political, or human rights type, tortures of single victims are listed below. Whether the loss of life involves the search and recovery of a single victim, or those of an entire community, the disciplined and contextual collection of evidence must be carried out. For this reason, many of the resources listed in sections such as **Reconnaissance, Surveying, and Mapping Techniques**, or **Excavation and Recovery Techniques**, or **Geophysical/Remote Sensing and Applications** are applicable at mass fatality scenes. The use of proper search, recording, and collection protocols at many of the above ground settings demonstrates the applicability of formal archaeological techniques which were once thought only relevant in subterranean settings. The reader interested in methodologies at large scenes should review the other sections of this bibliography.

This section is divided into the following categories:

Air Disasters	2306
Mass Graves and Conflict Archaeology	2320
Other Mass Fatalities and General Topics	2357

(Image Source: www.pixabay.com)

Air Disasters

Whether they involve small or large vehicles, aircraft crashes can entail debris fields over acres or even miles. Fragmentation of that debris, whether it be human remains or vehicle parts, also ranges in size and may be distributed in subterranean (impact crater), terrestrial, and arboreal contexts. Of all potential crime scenes, those involving the intentional destruction of an aircraft involves the application of almost every discipline addressed in this bibliography. From the most applications of mapping techniques to the less obvious applications of palynology (Graham, 1997) in **Botany and Related Areas**.

Holocaust Memorial near Berlin, Germany

Mass Graves and Conflict Archaeology

In the United States, examples of mass graves have been limited to historical atrocities such as the Wound Knee Massacre of 1890 or the Mountain Meadows Massacre in 1857, as well as the results of mass epidemics, natural disasters or the internment of the unidentified such as New York's Hart Island. The crime scene context of mass executions and subsequent burials for the purposes of ethnic cleansing or political purposes were brought to modern light with the Holocaust but continue as witnessed by sites in Rwanda, Sri Lanka, Croatia, Chechnya, El Salvador, South Sudan, Chad, et cetera. The more general references to human rights violations contained in the "Other Mass Fatalities and General Topics" subsection of this section will also contain references to the mass internment of political, genocide, or war victims.

Other Mass Fatalities and General Topics

Included within this sub-section of the bibliography are those instances of mass death which do not neatly fit into the above categories. Also included are theoretical or technical discussions concerning mass deaths in general, regardless of the means. It also contains references which generally apply to all mass disaster instances. (1095 citations)

Funeral Columns in Thailand

General and Cultural Anthropology of Death

The use of cultural anthropology in examining ritual or cult crime scenes is well documented. The compiler contends that a general knowledge of various cultures' attitudes toward death and the handling of the dead, may become useful in analyzing inter- and intra-cultural homicides. This is not to say that homicides are committed in the same manner a traditional death or burial/disposal might be treated. We all carry, however, "cultural baggage" which has ingrained beliefs, customs, rituals, and practices to a degree where they might be subconsciously acted on in the commission and concealment of crimes. The compiler is aware of at least one reported case in which, when interviewed, the subject claimed he had to bury the spouse he just killed in a particular place and position, because of the family's religious and cultural background. Articles related to prehistoric burials are included for the contextual information they may provide. They offer an evolutionary view, across cultures, of funerary customs and perspectives on death. Citations in this section may be inter-related to those under "Criminal and Cultural Behavior" and even "Taphonomy-Decomposition" ie. bog bodies. This section is even more closely related to the next concerning "Criminal and Cultural Behavior".

Criminal and Cultural Behavior

The impact of one's culture on daily activities is inescapable. That impact, whether conscious or not, must in some ways extend to the commission of crimes as well as victim reactions. The compiler witnessed this in the investigation of the abduction and murder of a young Bosnian girl who had resettled in the United States with more than 8,000 other refugees from the Balkan Wars of the early 1990s. The ease with which her neo-Nazi murderer was able to enter the homes of the Bosnian refugees, and ultimately kidnap this victim, was partly the result of the cultural experiences of the victimized families who feared law enforcement in their home country and so were reluctant to report the predator who introduced himself into their community as a health inspector. This category includes citations beyond those about death rituals and includes references about criminal psychology, cultural studies, and forensic psychiatry. A greater understanding of the psychological and cultural motivation subjects might have in committing crimes will impact approaches to searching for, and processing, evidence. One need not be a behavioral scientist or criminal profiler to realize that a subject diagnosed with paranoia might dispose of a victim in a manner different than a sociopath. An example of cultural influence in the selection of a victim's disposal site is the case of Jeremiah James Bringsplenty. Accounts of this 1992 case included that of the abuse and murder of Jeremiah by family acquaintances who were babysitting the infant in his Clarksville, Tennessee home. Both the victim and the subjects were of Native American ancestry. The subjects left Tennessee for the Rosebud Reservation in South Dakota with plans to bury Jeremiah near relatives. Because of decomposition, however, they were forced to stop outside Lincoln, Nebraska to bury the remains. This section also contains references valuable for investigators interviewing subjects and witnesses. This category and "**General and Cultural Anthropology of Death**" overlap to some degree. The examples or accounts examined in the resources within this section involve a spectrum of physical traumas which might befall victims of homicide or suicide. For that reason, the reader/research should also look in **Taphonomy-Trauma** for related citations.

General Crime Scene and Death Scene Investigation

This bibliography would not be complete without the inclusion of references to the general topics of crime scene and criminal investigation. Just as the compiler emphasizes the need for law enforcement to understand the training and practices of specialists he might call to a crime scene, it is important for the non-law enforcement practitioner, or civilian expert, to understand the training to which an investigator is exposed. The non-forensic expert consulted by law enforcement must remember that crime scene processing includes procedures for avoiding cross-contamination and insuring proper chain of custody. A premise of Melissa Connor's Forensic Methods, (2007), is this introduction of criminal investigators and non-law enforcement to each other's viewpoints. The formally trained archaeologist and criminalist will find in common, goals of systematically documenting, collecting, and interpreting physical evidence for the purpose of understanding factors which affected the depositional history of that evidence, and ultimately elucidating human behavior in a very precise way. For both disciplines the comprehensive documentation of the physical evidence in its contextual setting is paramount. the greatest handicap for the academic forensic specialist is coping with the paradox of being pressured to process crime scenes as efficiently as possible. Research projects involving relatively trivial subject matter are often afforded more time than scenes which literally involve circumstances of life and death. The researcher may find the sections on **Excavation and Recovery Strategies; Planning, Reconnaissance and Mapping Techniques; and Mass Fatality and Human Rights Investigations** cross referenced here or compatible with citations found below. Nonfiction Accounts of Buried Body Cases

The following citations are provided as anecdotal information about some of the more prominent cases in which the victim, or at least one victim of a serial murderer, was buried. They may be helpful in understanding what took place in particular crimes before and after the discovery of the victims. These nonfiction accounts mention victim-subject dynamics as well as relationships victims or subjects had to particular crime scenes. The compiler has found such accounts useful in reflecting third party, non-law enforcement observations on the manner in which particular crime scenes were processed. A strong caveat is presented in realizing that the accounts may or may not be based on police reports. They should not replace first hand reports of crime scene methodologies. On the other hand, some witnesses may be more willing to speak openly with the authors of those accounts, than law enforcement officers. Again, these are simply resources which require assessment and vetting by the researcher who considers them. Also included in this section are case histories and biographies by forensic anthropologists. When known, the name of the convicted suspect(s), of whom each account is written, is (are) noted in blue next to the citation.

Expert Testimony and Ethical Conduct

The least taught, and perhaps least “teachable”, aspect of forensic science deals with the court presentation of crime scene and laboratory observations. Courtroom presentations are subject to individual levels of knowledge, personality, and verbal skills. References below can offer suggestions on effective testimony, but no amount of training or advice will replace practical exposure. Perhaps the most valuable forensic science courses, or training, are those which incorporate a moot court exercise. We always learn the most from our mistakes. In no other venue are our shortcomings in processing crime scenes better highlighted than a fair and knowledgeable cross-examination. Many of the citations are specific to certain disciplines such as forensic psychiatry and psychology or forensic engineering; however, the maxims inherent in testifying in such specialized areas can be universal for all forensic experts.

The second area covered in this section involves ethics in law enforcement and forensic science. Unfortunately most of the disciplines covered in this bibliography have been tainted at one time or another by unethical conduct by what fortunately are exceptions among qualified and upstanding practitioners. In "**Canine and Scent Detection**," we referenced the puzzling and criminal conduct of cadaver dog handler Sandy Anderson. In 1993, Craig D. Harvey, a New York State Police Trooper was charged with fabricating evidence. Harvey and other troopers were convicted for transferring fingerprints of suspects from items they were known to handle, to fingerprint evidence cards falsely used as evidence against the suspects. This trooper justified his actions by only insuring there was evidence against individuals he felt certain were guilty. During his tenure as a West Virginia State Police Serologist, Medical Examiner Fred Zain was found to tamper with evidence and perjurer himself. More recently an FBI Laboratory Examiner was also charged with providing false testimony; and the results of FBI forensic hair examinations have been questioned. The impact of decisions by a corrupt officer or forensic scientist to plant evidence, alter a scene, short cut a procedure, fabricate reports, et cetera, impacts far more than the lives of that individual and the outcome of his cases. It taints the discipline in general and erodes the trust that the public desires in investigators. Most importantly, it forever impacts the falsely accused and victims who thought justice was served but learned it may be denied.

Juries continue to become more and more sophisticated in their understanding and expectations of forensic scientist. The popularity of fictional television programs such as "CSI" or "Bones", as well as non-fiction reconstructions of solved criminal investigations have provided laypersons insight into the principles of forensic science, but tend to exaggerate the processes and results. No longer do juries take as gospel the word of the expert witness. Right or wrong, they compare the application of different techniques with what they have seen on TV. What has been coined, "The CSI Effect" has impacted prosecution to the point that attorney's include discussions of juries knowledge or acceptance of television crime scene investigation in voire dire phase of some trials. Some subjects may opt for bench trials rather than jury trials. They hope that a judge may have a more realistic understanding of the limitations of forensic sciences.

The citations listed below, unlike those in other sections, can be of universal aid to specialists in any forensic science discipline. Familiarity with courtroom protocol, and the subtleties of expert testimony, cross forensic specialties and rely on basic common sense, etiquette and a clear understanding of the topic to be presented during testimony.

Related Websites

The Internet contains a wealth of resources for, and by, crime scene investigators and forensic scientists. Like all of the sections in this bibliography; however, the value of those resources must be weighed by the researcher in light of the source and developments within the discipline under consideration. Internet resources can and should be considered in the course of ongoing crime scene investigations in order to acquire needed environmental background about the scene, parties involved, and circumstances. For example, preparation for any outdoor search should begin with a review of available aerial imagery, (Google Maps, Bing Maps, All Trails, etc.), soil descriptions, (United States Geological Survey, Soil Conservation Service), climate conditions, (National Oceanic and Atmospheric Administration), et cetera. In another example, the application of survey technology in crime scene documentation sometimes requires referencing the crime scene survey to a national system of geodetic benchmarks and State plane survey systems that have been in place since 1927. The location of benchmarks closest to the scene can be determined through Internet sites such as the National Geodetic Survey Data Explorer (<http://www.geocaching.com/mark>)

The interpretation of an outdoor scene requires not only the collection of trace evidence but the analyses of that evidence in light of climatological data and topographic parameters. Websites such as those for the National Oceanic and Atmospheric Administration, National Climatic Data Center (NOAA), or the National Geological Survey could be helpful. Professional Sites such as those for the American Board of Forensic Anthropology, Association of Crime Scene Reconstructionists, or International Association of Blood Pattern Analysts, offer not only information and links about their specialty but also list experts who may be within a particular investigator's region. The following websites are not necessarily endorsed by the compiler and should be assessed by the users for their own purposes.
