Isotopic Evidence

Popular and scientific references to the use of stable isotopes in identifying skeletal remains; or, more accurately, identifying geographical ranges in which the decedent may have lived, are the focus of this section. It also includes topics such as Carbon 14 dating and bomb pulse data. Stable isotope analyses may provide investigators clues to the spatial history of unidentified victims. Our bones and teeth, throughout our lives become reservoirs for those chemical elements to which we are exposed. The longer those exposures to the varied concentrations of different elements in different areas of the world, the more likely the victim can be determined as having resided in a particular area. By knowing the areas inhabited by a victim, the more likely investigators will be able to track down his, or her, identity. Unlike radioactive isotopes, stable isotopes never disintegrate. Schwarz, (2007), provides a good example of the forensic value of stable isotopes:

"Most of the O atoms in our body come from the water we drink, and is usually isotopically like the precipitation where we live. Therefore we can often learn where a person lived from the isotopic composition of their teeth and bones. Fortunately we now have maps showing the distribution of $^{18}\text{O}/^{16}\text{O}$ ratios in precipitation falling over North America and Europe which we can use to help trace the place of origin of a murder victim. Even burned remains can be analyzed this way."

(Schwarz, 2007:28)

Like DNA, stable isotope analyses will continue to be developed and be refined. And like DNA analyses, it may someday be a staple in the forensic scientist's toolbox.

Because stable isotope analysis is so dependent on the proper collection of known environmental samples, the researcher is also referred to the section **Geoarchaeology and Soil Science**. Our culture obviously impacts and reflects where we live and what we consume. For those reasons, the researcher may find useful citations in the section entitled **Criminal and Cultural Behavior**. That said, crime scene investigators should also remember that other animal species and plant life associated with crime scenes, also reflect stable isotope signatures which may aid in reconstructing crime scene events.

Firearms, Projectiles, and Tool Mark Evidence

The references in this section address the three primary topics of forensic firearms and ammunition analysis: Internal or Initial Ballistics, External or Transitional Ballistics, and Terminal or Wound Ballistics. Of those topics, those concerning wounds are contained in, or cross referenced to the subsection of trauma within this bibliography's **Taphonomy** section. The effects of gunshot residues on materials near discharged weapons may impact trace evidence such as hairs and fibers, as well as substrates such as the human skin of both the victim and suspect. It is not only firearms which are addressed, however; the science of ballistics also affects projectiles of any description.

Because the examination of bullets and cartridges is a primary area of tool mark examination, this section also includes that on "General Toolmark Evidence". Beyond ammunition, tool mark examinations include impressions left by cutting or prying tools used in burglaries or forced entries. They also comprise a major component of Geotaphonomy in the form of toolmarks left by digging implements in the walls of pits used to conceal buried evidence, or the backdirt of same (Hochrein [1997]). Fingers, teeth, and feet are, technically, tools which can also leave impressions or marks on victims or other substrates at a crime scene. For this reason, the reader is directed to the categories of **Trace and Impression Evidence**, and "Bitemark Evidence" in **Taphonomy**, citations which discuss such marks.

This section is divided into the following categories:

Firearms and Ballistics Evidence	2002
General Toolmark Evidence	2106

Manual measurement of the vertical and horizontal angles of a ballistic trajectory established by rods

Firearms and Ballistic Evidence

Like blood pattern evidence, the reconstruction of shooting incidents rely on the certainty of trigonometric calculations combined with the intuition seasoned crime scene investigators and technicians bring to the investigation. Their experience with the products of human nature, emotion, and intellect helps to guide the application of science and math at each shooting or blood spatter scene. Beyond the scene, the analyses of each of its components such as the projectile(s) or their traces complete the clues available to solve the crime. This category in the bibliography contains a variety of references dealing with gunshot residues, ammunition components, weaponry, and the substrates affected by impacting or penetrating projectiles.

Geotaphonomic tool marks left in the walls of a pit and its backdirt

General Tool Mark Evidence

Almost anything may be used as a tool to pry, pull, break, drill, or otherwise breach a door or window into an area, making it a crime scene. Similarly, a variety of tools can be used to cut, scratch, incise, or tear any type of substrate including the excavation of a clandestine pit. From teeth to backhoe, tools leave marks. Those marks may be overlooked or obliterated in the course of processing a scene with techniques which may not consider the recognition and documentation of tool mark evidence. This section is particularly central to this bibliography in that this resource, by title, has as its emphasis - Geotaphonomy. One of the six tenets of forensic geotaphonomy is tool mark evidence within, or associated with the construction of a clandestine subterranean feature. Tool marks may be one of the most overlooked types of evidence in a crime scene. They are certainly are in the forensic excavation of buried features. With the compilation of the following resources it is hoped more attention is drawn to this evidence topic.

Miscellaneous Trace Evidence

References in this section, like fingerprints, ballistics, and blood evidence, are most often thought of in traditional criminalistics or police sciences. Some of the references below date to the early days of forensics and criminalistics. This section is included because it represents one of the six areas comprising Geotaphonomy: Stratification, Tool Marks, Bioturbation, Sedimentation, *Compression/Depression (foot and shoe prints)*, and Internal Compaction. In addition to the recovery and interpretation of impression evidence, other trace evidence which might be found on surface and subsurface death scenes are cited. Entomological and botanical evidence also constitute trace items left or taken from crime scenes. Because of the number of works referencing those topics, they are addressed in respective sections in this bibliography. Some citations in this section could also be cross-referenced with those in **Taphonomy** given their discussion of the deterioration, or decomposition of hairs and fibers among victims' remains or contamination of impression evidence through prolonged exposure at crime scenes.

When this compiler first became interested in forensic science, one of the first references he read, and which most influenced subsequent processing of scenes and research, was *Crime Investigation* by Paul Kirk (1974). In that paper the words of Kirk serve as the foundation for collecting trace evidence at any scene regardless its age or condition:

"Wherever he steps, whatever he touches, whatever he leaves, even unconsciously, will serve as silent witness against him. Not only his fingerprints or his foot prints, but his hair, the fibers from his clothing, the glass he breaks, the tool mark he leaves, the paint he scratches, the blood or semen he deposits or collects. All of these and more bear mute witness against him. This evidence does not forget. It is not confused by the excitement

of the moment. It is not absent because human witnesses are. It is factual evidence. Physical evidence cannot be wrong. It cannot perjure itself. It cannot be wholly absent. Only its interpretation can err. Only human failure to find it, study and understand it, can diminish its value."

Beginning with this edition of the Bibliography, Shoe and Tire Impression Evidence has been taken out of this section as a subcategory and made a section of its own.

This section is divided into the following categories:

Fecal or Coprolite Evidence.	2130
Hair and Feather Evidence	2138
Fiber and Textile Evidence.	2177
Other Trace Evidence Topics	2208

(Image Source: www.pixabay.com)

Fecal or Coprolite Evidence

Left with a paucity of biological evidence, archaeologists are trained to recognize, and paleobiologists have developed expertise in examining the content of, animal waste. Feces are often encountered at crime scenes but just as often not recognized for their forensic value. Death scenes involving scavenged remains should automatically be examined for scat. They may contain missing skeletal elements, jewelry, or other evidence associated with the incident. The presence of human feces within a crime scene hopefully is not the result of scavenging but more likely physical evacuation from the victim ante- or perimortem, or perhaps the product of a psychologically motivated act by the perpetrator(s). As with most categories of evidence, the context of such a “message” left by a suspect might be the topic of citations contained in the sections entitled **Criminal and Cultural Behavior** or **General Crime Scene and Death Scene Investigation Topics**.
