Disease, Illness, and Physical Abnormalities

We are defined, in part, by life experiences. Some of these experiences become part of our physical being. Obviously, injuries which fracture bones or surgeries to install medical appliances, are used to uniquely identify questioned remains. To narrow the population of possible identities, forensic anthropologists also examine remains for evidence of disease or illness. Conditions such as osteoarthritis or tuberculosis typically leave skeletal lesions which identify the afflictions long after death. More subtle may be patterns of wear or stress on skeletal elements supporting possible dominant handedness, or repeated motions and loads required by different physically demanding trades.

Articles on paleopathology are abundant in this section. In disciplines which rely predominantly on surviving skeletal elements, archaeologists and physical anthropologists have originated or advanced the analyses of diseases, illnesses, and physical abnormalities reflected in human remains. They have also advanced considerations of diet and nutrition from the chemical composition of bones as well as their physical size and condition. For this reason, the researcher interested in this section should also check out that on **Stable Isotope Analyses**. Just as the isotopic record is stored in our skeleton, hinting at the locations we've lived throughout our lives, so does the chemical composition of our remains suggest dietary deficiencies or access to more or better resources. Such considerations should draw on interest into the decedent's cultural background or influences. For this the reader is directed to applicable citations within the **Criminal and Cultural Behavior** section of this bibliography.

Thermal Alteration or Influences

The citations in this section of the bibliography address the effects of temperature ante-, peri-, and post-mortem. Hypo- and Hyperthermic reactions preceding death may account for the context of artifacts within a scene. Most crime scene investigators are familiar with the phenomenon of paradoxical undressing in which a final symptom, or reaction of hypothermia involves the afflicted feeling such a sensation of warmth that he sheds his clothing. To the untrained, or unfamiliar, eye the discarded clothing might suggest a sex-related incident. The lack of clothing on decomposed remains might also imply the death occurred on a hot day or night. In arson scenes the position of the body may appear to be defensive when what is referred to as pugilistic posture is the result of the constriction, but incomplete consumption, of muscles in the presence of extreme heat. Postmortem ambient temperatures are the basis for establishing postmortem interval using insect succession. Citatons in this section may cross-refeence to some under **Entomology**. Similarly, scene temperatures, over time, influence postmortem characteristics such as lividity and rigor. In that continuum of decomposition temperature is foremost in its rate of advancement. The condition under which a victim's body might be disposed obviously influences the postmortem context in which it, and associated evidence, is found. In a buried body case of which the compiler is familiar the extremely shallow grave dug by the subject was the result of frozen soils the January night of the murder. Climate, or temperature, impact both taphonomy and geotaphonomy.

This section is divided into the following categories:

Cold Environments	653
Hot Environments	662

(Image source: www.pixabay.com)

Cold Environments

Perhaps one of the most reported applications of archaeology and taphonomy to a frozen environment is the 1991 discovery of the "Tyrolean Iceman" nicknamed Ötzi . His discovery as been reported in a variety of literary genre, including forensic science journals and literature, (ie. Bereuter, T.L., et al. [1997]As with many of the citations through this bibliography, findings and analytical developments from a non-crime scene setting have served to advance forensic applications. An Internet search of works based on the discovery and analysis of Ötzi include protein analyses, bloodwork, tattoos and body modifications, trauma, et cetera. (149 citations)

Hot Environments

The complete cremation of a body is virtually impossible without extraordinarily high and sustained temperatures. For this reason the murderer's attempt to completely dispose of his victim's corpse in a staged house fire, or with a contained blaze of accelerant are rarely successful. A case which began this compiler's interest in law enforcement and the use of archaeology in forensic science, involved an attempted cremation. In 1966 a teenage girl disappeared in Western Pennsylvania. Twenty two years later a team of archaeologists from the University of Pittsburgh were asked to assist the Pennsylvania State Police in the excavation of a site which might hold her remains. The State Police found the rural wood site through a description unwittingly given by the subject to an informant. The archaeological excavation over a week uncovered a cabin foundation which had been infilled in 1966 after a fire. The excavation revealed a metal bed frame which had fallen through from an upper floor in to the cellar. Further excavation including that of a block of soils taken to a laboratory setting revealed hundreds of cremains. A forensic anthropological analysis of those remains revealed an the sex and approximate age consistent with the victim's description. Ultimately, the suspect confessed to her murder and concealment by intentionally burning the abandoned cabin.

Taphonomy – Scavenging, Animal Attacks, Faunalturbation, and Bitemark Evidence

This section of the bibliography includes references to the effects non-insect scavengers impart to human remains before, during, and after death. A subcategory of bitemark evidence accompanies scavenging more because they share the method than the motive. Although articles on cannibalism are included and might be considered scavenging in some survival situations, most involve research into typically violent sexual encounters between victims and attackers. Because such wound trauma is so often a signature of masochistic or sadomasochistic encounters, references in **Criminal and Cultural Behaviour** should be considered toward understanding motivations and contexts behind this and other taphonomic clues left on a body. The bitemark citations herein do not focus on all topics of forensic odontology. Instead, those specifically addressing bitemark evidence are included. The collection of DNA evidence should always be from possible bitemarks. Therefore, there are cross-references between this category and **DNA Evidence**. Likewise, articles on trace evidence such as lipstick/gloss and facial hair may be pertinent to a particular investigation in which bitemarks are found on skin or food associated with a crime scene. If DNA should be considered a component of bitemark evidence, then so should friction ridge detail. Latent and patent hand and finger prints may be recovered from a bitten victim’s skin or substrates near or under the body.

Whether it is the family dog or mountain lion in the wild, animals will exploit available food sources and human remains may be among them. What goes in, must come out; so this sub-category of the bibliography dovetails with **Fecal and Coprolite Evidence** under **Miscellaneous Trace Evidence**. The most numerous and voracious of any scavengers are among forensically significant insects. The volume of research and citations in forensic entomology have justified a category of its own within this bibliography.

This section is divided into the following categories:

Scavenging, Animal Bites and Faunalturbation	707
Bitemark Evidence	750

Scavenging, Animal Bites and Faunalurbation

Human Bite Mark Evidence

Historically, bitemark analysis, like forensic entomology, scent detection, and even fingerprint evidence, has undergone scrutiny as to whether or not it constitutes science. Media accounts of wrongful convictions originally based on bite mark evidence seem to have increased. For example, Radley Balko's October 22, 2015 Washington Post essay entitled, "More overturned convictions, more scrutiny for bite mark analysis" (www.washingtonpost.com/news/the-watch/wp/2015/10/22/more-overturned-convictions-more-scrutiny-for-bite-mark-analysis/ [accessed 7/04/2016]). The Innocence Project notes particularly alarming rates of false identifications. For example, it cites an American Board of Forensic Odontology study which found 63.5% error rate in bite mark identifications (www.innocenceproject.org/cases-where-dna-revealed-that-bitemark-analysis-led-to-wrongful-arrests-and-convictions [accessed 07/04/2016]). Some of the citations herein address those discussions. One can not argue, however, that bites as defensive acts or as marks reflective of anger or sadism, often occur on both subjects and victims. They may equally as often be overlooked at the scene or autopsy. The comparison of the mark to known or questioned dentition, like latent print comparisons, requires not only skill and experience, but also appropriate and complete collection techniques at the outset, and qualified oversight in the end. Bitemarks within a crime scene are not limited to marks left on human tissue. Hungry burglars, or other offenders, have been known to discard chewed gum, bitten fruit, and other gnawed items at, or near, the scenes of their crimes. In addition to possible DNA, the bite marks offer direct evidence of their creator. Because the jaw and teeth are often used as a tool, and bite marks are therefore toolmarks, The reader is directed for additional citations in that subcategory within this bibliography. (559 citations)

Taphonomy - Trauma

Traumatic defects to soft tissue and skeletal elements may be ante-, peri-, or post-mortem in nature. Antemortem, their position and frequency may evidence a history of abuse, suicidal tendencies, or serve as a means of identification. Perimortem they evidence actions during the criminal incident and therefore the event. Antemortem, traumatic defects may reflect behavior by actor(s) to ritually or otherwise intentionally "harm" the victim. It might also reflect poor, inappropriate, or hurried recovery techniques. The recognition of how subtle taphonomic evidence of trauma might be, and how similar they can appear to modification by natural agents or disease, should cause the crime scene investigator to take precautions by employing appropriate recovery methods. For example, the often discussed "forensic backhoe" has little place in the recovery of buried human remains without a very precise understanding of where those remains lay within the search area. Nor should rakes, picks, maddocks, and other trauma inducing tools be used for the same reasons and especially in the hands of the untrained. This section of the Bibliography seeks to present citations about a variety of traumas associated with violent acts among individuals or to themselves.

Edged, Incised, Hacking and Impaling Traumas	0779
Blunt, Fracture, and Crushing Traumas	0829
Hangings, Asphyxial Injuries and the Use of Ligatures	0893
Ballistic Wounds	0923
Miscellaneous, General, and Other Traumas	0987

Clothing removed from victim of stabbing upon autopsy

Edged, Incised, Hacking, and Impaling Traumas

Among the more spectacular, or gruesome, injuries encountered within accidental or intended death scenes are those classified under sharp or edged forces. The physical acts which cause such injuries are intimate acts. In interpersonal attacks they require the victim and subject to be in close physical contact. Even more psychologically intimate than distance is the requirement of edged weapon attacks that the subject, or victim in the case of suicide, feel the impact the weapon has in creating the trauma. For this reason the reader is referred to citations under **Criminal and Cultural Behavior**. As with ballistic wounds, topics of tool mark examination consider characteristics of edged weapon wounds. Those marks may extend from the substrates of the victim's outer garments into that of bone. Because edged trauma, like blunt and ballistic wounding, may generate patterned blood stains, citations under **Blood Stain Identification and Interpretation** may aid researchers using this bibliography. An interesting and perhaps unconsidered cross-reference to the instant section is to **Finger, Foot, Ear, Lip Print, Palate and Body Modification Evidence** in as much as scarification constitutes healed edged wounds. Hacking trauma has been included within this category. Unlike other wounds created by edged implements, the act of hacking imparts blunt trauma in addition to sharp force injury. Therefore, citations included under **Blunt, Fracture, and Crushing Traumas** may include reference to hacking injury. Penetrating wounds, like incised or stab wounds as well as bullet wounds, are often sites to which scavenging insects are first attracted. Citations under **Entomology** may discuss same.

Bruising on an elderly assault victim

Blunt, Fracture, and Crushing Traumas

Unlike other types of trauma, blunt force injuries are typically attributable to a much wider array of causes. General references to forensic pathology will contain chapters addressing each type of trauma including blunt injuries. There may also be some overlap between blunt traumas and hacking traumas which have been categorized in this bibliography with edged trauma – **Edged, Incised, Hacking and Impaling Traumas**. In hand to hand combat the most basic implement may be the fist or the action of grabbing the victim's head, arm, back, or other body part and striking it against a solid surface. Innumerable objects can be used as weapons to create fracture and crushing injuries. The most extreme force creating blunt traumas are generated in vehicular crashes or disasters. For this reason the reader is invited to look through the section of the bibliography that addresses **Mass Fatalities** All injuries to soft and skeletal tissues are, in effect, tool marks. Articles discussing tool marks left in synthetic substrates may be encountered under the sub-section entitled general tool mark evidence. Crushing injuries may be the result of being run over by a vehicle. One will find articles related to tire mark evidence on clothing and soft tissue under **Shoe, Foot and Tire Impression Evidence**. Another category which can be cross-referenced with this and the other Trauma sub-sections is that on "Blood Stain Identification and Interpretation". Blunt trauma is typically associated with medium velocity blood stain patterns.

Ligature marks exhibited by the victim of a staged hanging

Hangings, Asphyxial Injuries, and the Use of Ligatures

This sub-section, within the of taphonomic indicators of trauma, concerns those injuries typically associated with impediments, or trauma, to the airway. In the situation of suicidal, homicidal, or accidental hangings as well as vehicular crashes, additional traumas may present in the cervical area of the spine. Bruising, echymosis, as well as the presence of petechia in various tissues throughout the body are also typical of such deaths. For these reasons this bibliography's user might want to look through those sections with **Miscellaneous Topics in Taphonomy**. Perhaps one of the more often staged, or misinterpreted, types of death scenes are those involving hangings. Auto-erotic, versus suicidal, versus homicidal, situations may take on the appearance of the other or be posed to do so. This bibliography's sections on **Criminal and Cultural Behavior** and **General Crime Scene and Death Scene Investigation** contain numerous case examples which may be of aid. For the crime scene reconstructionist a subsection like **Miscellaneous Trace Evidence** might be useful in locating research which has been published or presented on the analyses of knots. Extreme cervical and neck trauma may result in decapitation. For that reason applicable citations could be found in the **Taphonomy** sub-section created for **Edged, Incised, Hacking and Impaling Traumas**. Some of the titles in that sub-section, as well as **Blunt, Fracture, and Crushing Traumas** may have not been specific enough to identify them as containing discussion of those types of trauma which could result in asphyxial deaths. As examples of how other different evidence categories might impact this topic of neck traumas or strangulation deaths, consider the examination of victims for fingerprints on their skin; or the use of forensic light technology and photography in revealing evidence not visible under more ambient conditions. (591 citations)

Gunshot wound at the top of the cranium received during a drive-by shooting incident

Ballistic Wounds

One of the largest sub-sections of individual trauma referenced in this bibliography is that of ballistic wounds. Over a thousand references are cited in this edition. Naturally, this section goes hand in hand with that titled **Firearms, Projectiles, and Tool Mark Evidence** and specifically its sub-section of **Firearms and Ballistic Evidence**. The sub-section within the **Taphonomy** sections usually represents the final or terminal area of ballistic science. An understanding of wounds in the context of initial and transitional ballistics is required to reconstruct a shooting or death scene. Additionally, a working familiarity with firearms and ammunition characteristics and components is fundamental toward scene reconstruction. Beyond the weapons and wounds, various substrates may be affected during the flight and impact(s) of a projectile. For this reason the researcher is asked to consider the **Fiber and Textile Evidence** and **Other Trace Evidence Topics** sub-sections of **Miscellaneous Trace Evidence**. Hejna and Šafr (2010b) is an example of a transitional or near-terminal ballistic study which addresses the impact of the projectile and gunshot residues on clothing worn by the victim. Other sections of this bibliography which should be considered when researching ballistic wounds include **Criminal and Cultural Behavior** for possibly determining the decision process involved in the selection of particular weapons and whether those weapons are used on oneself or another. Circumstances surrounding a shooting incident might be reflected in case studies or accounts presented throughout **General Crime Scene and Death Scene Investigation** and **Nonfiction Accounts of Buried Body Cases**. Even the search for expended bullets or shell casings and/or secreted firearms might be aided through a review of **Geophysical/Remote Sensing Technology and Applications**. (1294 citations)

Miscellaneous, General, and Other Traumas

This sub-section includes those titles which indicate combined traumas, unique causes, or are unclear in the specific trauma discussed. For example, blast injuries typically consist of a variety of exaggerated and typically overlapping penetrating, ballistic, sharp edged, and blunt wounds. The user of this bibliography should examine the contents of this section in as much as it may contain references and case examples discussing the more singular topics above in the context of other wounding mechanisms and traumas. Several of these references also address general or introductory discussions of different types of trauma.

General and Miscellaneous Topics Related to Taphonomy

The following citations consist of those which did not seem to fit any of the other taphonomy categories, are combinations of categories, or discuss taphonomy generally. Some address forensic anthropological techniques while others describe traumas or conditions which do not comfortably fit into the other categories under the heading **Taphonomy**. Many of these citations may cross-reference to other categories given their diversity. For example, someone interested in commingled human remains should check this bibliography's section on **Mass Fatality and Human Rights Investigations**. As with each of the categories in this Taphonomy section, **Criminal and Cultural Behavior** helps explain the context of the original traumas.
